Mo2Go Website Analytics Setup Report

This report outlines the Google Analytics 4 (GA4) implementation for **mo2go.co.uk**. The tracking is designed to help you understand user behavior, measure the effectiveness of the website, and track key conversion actions.

1. Automatic Core Metrics (Built-in)

By implementing the base GA4 tracking code, the system automatically collects several essential data points about visitor behavior without requiring any manual interaction.

- **Page Views (`page_view`)**:
  - *What it means:* Triggers every time a user loads the website.
  - *Why it's important:* Shows you overall traffic volume and how many people are discovering your service.
- **User Engagement (`user_engagement`)**:
  - *What it means:* Triggers automatically as users interact with the site (spending at least 10 seconds focused on the page).
  - *Why it's important:* Helps you separate accidental clicks and bots from real people who are actually reading your content.
- **Scroll Data (`scroll`)**:
  - *What it means:* Triggers when a visitor scrolls down past 90% of the page length.
  - *Why it's important:* Shows if visitors are making it down to the "About Us" and Footer sections, effectively reading the full pitch.
- **Session Start (`session_start`)**:
  - *What it means:* Marks the beginning of a user's visit to the site.

2. Custom Conversion Events (Manual Tracking)

Custom event trackers have been engineered directly into the website code. These are specific actions a user can take that directly relate to your business goals (booking a ride or getting in touch).

These events are categorized under distinct labels so you can filter and compare them in the dashboard.

A. Direct Communication Tracking

- **Phone Taps (`click_phone`)**
  - *What it means:* Triggers whenever a user clicks/taps on any of the `07365 450917` phone number links anywhere on the site.
  - *Why it's important:* Since your business heavily relies on phone bookings, this metric shows how many people used the website as a direct path to call you. (Often indicates urgent or immediate booking intent).
- **WhatsApp Clicks (`click_whatsapp`)**
  - *What it means:* Triggers when a user clicks the floating "Contact Us Now" WhatsApp button or the WhatsApp link in the Contact section.
  - *Why it's important:* Reveals how popular the quick-message chat option is compared to standard voice calling.
- **Email Taps (`click_email`)**
  - *What it means:* Triggers when a user clicks on the `bookrides@mo2go.co.uk` email link to compose a message.

- *Why it's important:* Completes the picture of how users prefer to communicate with the business.

B. Form Submissions Tracking

- **Successful Bookings & Inquiries (`form_submission`)**
  - *What it means:* Triggers **only** when a form is successfully submitted (after passing the hCaptcha check and honeypot spam protection). The tracking details whether it was a "New Taxi Booking Request" or a "Complaint/Lost Item".
  - *Why it's important:* This is your highest-value conversion metric. It confirms that the user filled out the required info and successfully fired off a request to your inbox.

How to Monitor these in Google Analytics

To view these metrics, log into your GA4 Dashboard (`analytics.google.com`):

1. **For General Traffic:** Navigate to **Reports > Engagement > Pages and screens** to see your raw page views and time spent.
2. **For Conversions:** Navigate to **Reports > Engagement > Events**. Here you will see rows for `click_phone` , `click_whatsapp` , `click_email` , and `form_submission` .
3. **Mark as Conversions:** We highly recommend setting the `form_submission` and `click_phone` events as "Conversions" inside GA4 (under the Admin panel). This allows you to specifically optimize ads and search rankings around people taking those actions.
